Recently I was consulting with a manufacturing company in direct competitive bid warfare with a lower-price opponent. My client was losing bid after bid. I said, "Something has to change here." They said, "It can't. We can't cut our prices any lower." I said, "If we can't come in with the lower bid, we might as well come in with an even higher bid - but let's change the rules of the game when we do it." They began changing the specifications for the bids, adding value, bundling goods and services together, extending warranties, and including delivery and completion guarantees. Then we built a "How to Compare Our Bid with Others Checklist." When it was all said and done, my client started getting projects the company had been losing to low bidders before.

Omega-3s, which are present in fish oil, are types of fats that many people incorporate into their diets to maintain good health. Unlike other fats, omega-3s appear to prevent heart disease and stroke. This has prompted experts to suggest that people eat two or three servings of fatty fish, like salmon and mackerel, per week. However, some prefer to take fish oil in capsule form instead as it has been assumed that supplements can offer the heart just as much protection. Now, there is doubt to this theory. Researchers performed 14 clinical trials in which participants with cardiovascular issues were randomly given either omega-3 supplements or placebos. Those who took the supplements suffered from cardiac arrest and congestive heart failure at the same rate as those who did not. Ultimately, experts still have faith in healthy oils derived from fish, but are currently recommending that patients seek natural sources as they are likely more potent than supplements.

- ① The manufacturing process causes fish oil to lose a lot of its natural potency.
② Health experts are recommending that people consume more fish than before.
③ There are now misgivings about the effectiveness of omega-3 supplements.
④ Supplements are a convenient way for people to reap the benefits of omega-3s.

Separation of church and state is a principle that calls for clear boundaries between religion and the government. Prior to the sixteenth century, religious establishments and the state were closely intertwined. A nation’s ruler could encroach into the spiritual sphere, and similarly, heads of church routinely advised on national matters. In the era of Enlightenment, however, philosophers argued that faith could not be governed by reason and that the government had no authority over a person’s beliefs. This new doctrine took hold in most Western societies, and in the face of industrialization and technological advancements, religion all but lost its influence in state matters.

Although the church and state were once wholly (A) _____, their segregation was facilitated by (B) _____.

Amid the confusion and clutter of the natural environment, predators concentrate their search on telltale signs, ignoring everything else. There is a great benefit to this: When you specialize in searching for specific details, even cryptically colored prey can seem obvious. But there is also a cost to paying too close attention, since you can become blind to the alternatives. When a bird searches intently for caterpillars that look like twigs, it misses nearby moths that look like bark. The benefit of concealing coloration is not that it provides a solid guarantee of survival, but that it consistently yields a small advantage in the chance of living through each successive threatening encounter. At a minimum, even a tiny delay between the approach of a predator and its subsequent attack can help a prey animal escape. And at best, the prey will be completely overlooked.

- ① Predators in Disguise
- ② Camouflage: A Slight Edge
- ③ Beauty of Concentration
- ④ Merits of Specialized Search
